

How to Set Up a Secure, Free Local AI Environment with Ollama and Claude Code 1.

1. Ensuring Maximum Privacy with Ollama. If you are looking for a completely private AI experience, Ollama is an excellent solution. It allows you to download and run various AI models entirely on your local machine. However, to guarantee your data remains secure, you must verify two key settings:

Enable Aeroplane Mode: This ensures that Ollama does not route your queries to the internet or utilise cloud-based models.

Disable Network Exposure: Ensure this setting is turned off so your local AI server refuses incoming API requests from other devices on your network.

2. Running Claude Code Locally for Free (Ideal for Computer Science Students) For CS students and developers looking to leverage Claude's exceptional programming capabilities without incurring API or CLI billing costs, you can route Anthropic's Claude Code directly through your private Ollama setup. This keeps your codebase entirely off the public network.

Note: The following instructions require Windows PowerShell 7 (x64) running in Administrator mode.

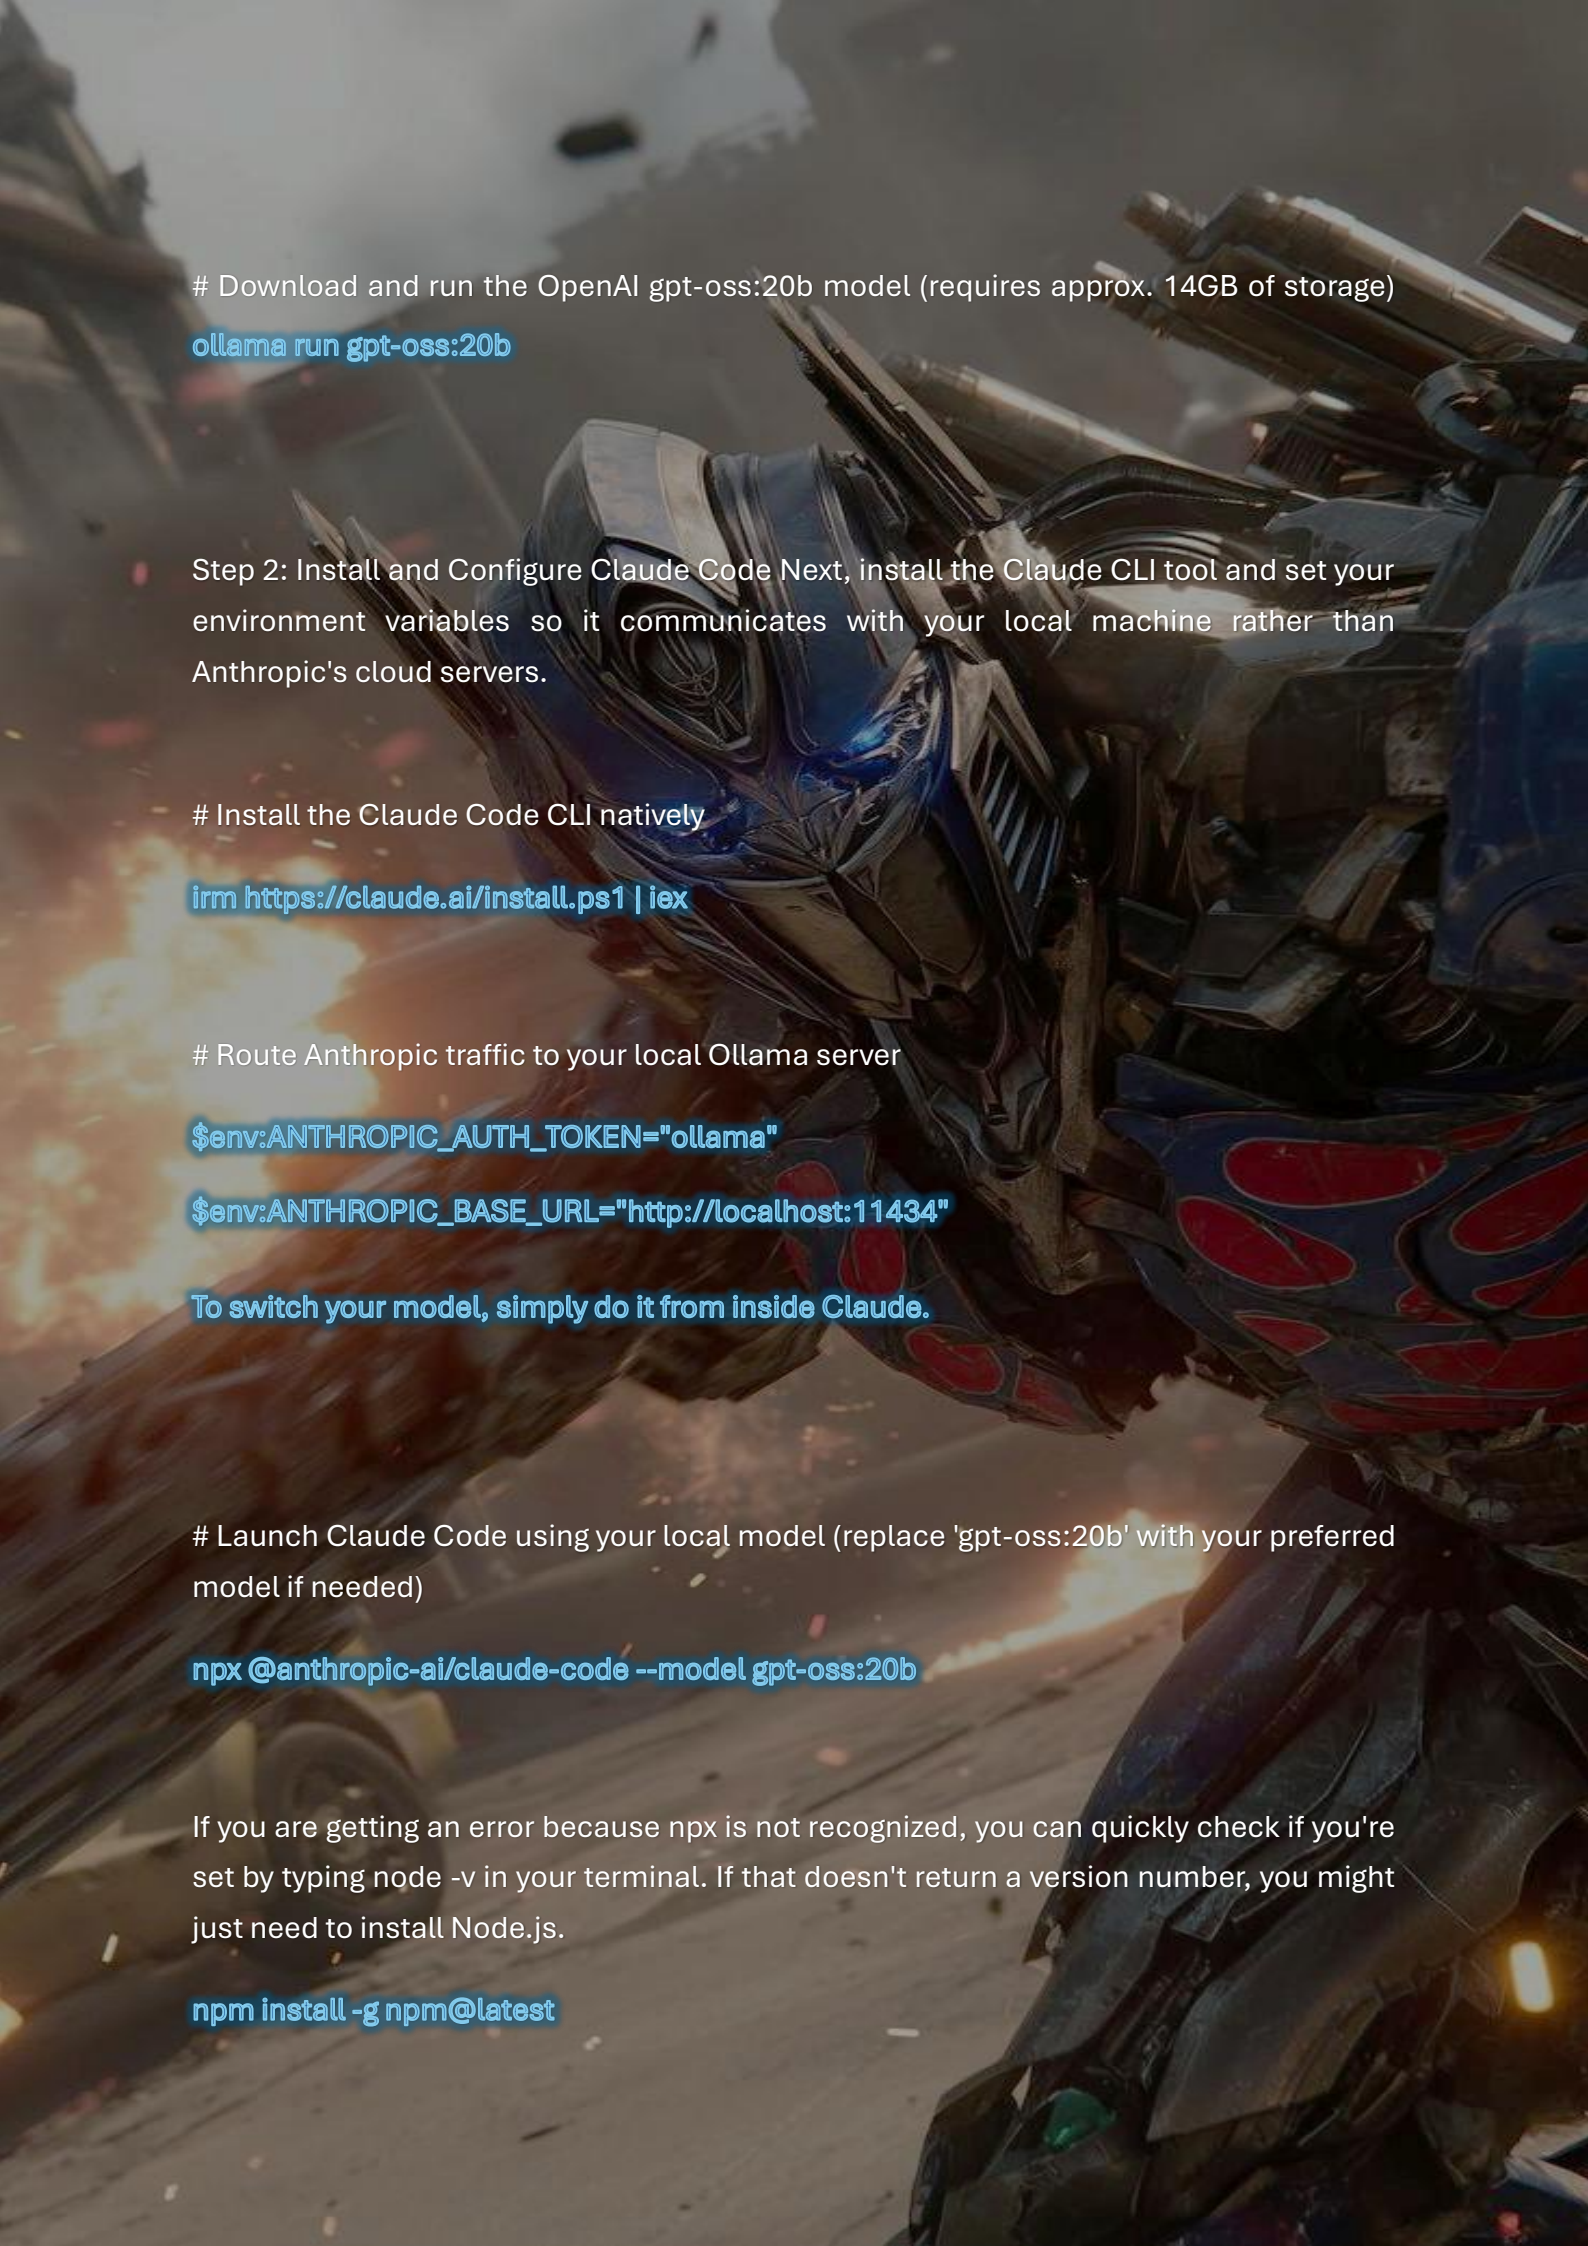

Step 1: Install Ollama and Download Your Model

First, install the Ollama engine and pull a highly capable, open-weight reasoning model.

PowerShell

Install Ollama via the Windows Package Manager

```
winget install --id=Ollama.Ollama -e
```

A background image of Optimus Prime from the Transformers franchise, shown in a dynamic battle pose. He is a large, blue and red robot with a complex, mechanical design. The scene is set in a dark, industrial environment with sparks and debris, suggesting a recent battle or ongoing conflict. The lighting is dramatic, with bright highlights on his armor and a dark, smoky background.

Download and run the OpenAI gpt-oss:20b model (requires approx. 14GB of storage)

`ollama run gpt-oss:20b`

Step 2: Install and Configure Claude Code Next, install the Claude CLI tool and set your environment variables so it communicates with your local machine rather than Anthropic's cloud servers.

Install the Claude Code CLI natively

`irm https://claude.ai/install.ps1 | iex`

Route Anthropic traffic to your local Ollama server

`$env:ANTHROPIC_AUTH_TOKEN="ollama"`

`$env:ANTHROPIC_BASE_URL="http://localhost:11434"`

To switch your model, simply do it from inside Claude.

Launch Claude Code using your local model (replace 'gpt-oss:20b' with your preferred model if needed)

`npx @anthropic-ai/claude-code --model gpt-oss:20b`

If you are getting an error because npx is not recognized, you can quickly check if you're set by typing `node -v` in your terminal. If that doesn't return a version number, you might just need to install Node.js.

`npm install -g npm@latest`
